

Spotlight MoveUp™ Services

Introduction

More often than not, the data warehouse infrastructure created by a business is the product of a series of a decisions rather than one clean-sheet design. As a result, the technology that was originally put in place may no longer fulfill the needs of the business or the cost structure for the current platform may have changed. That's where Spotlight's MoveUp service can help.

Spotlight's MoveUp services are specifically designed to help move the database, BI, and analytical infrastructure from one platform to another. MoveUp services include the following:

- Assessing the current database(s)
- Assessing future needs of the company
- Understanding the end-user needs
- Determining the size and capacity of the systems
- Migrating the schema
- Understanding application dependencies
- Assessing BI and analytic needs
- Determining any automation tools to use
- Normalizing and moving the data
- Tuning the new platform
- Testing the new database
- Deploying the new system(s)

As data warehouse / database technologies continue to evolve to cloud-based environments with subscription pricing, the economics of a database migration may make sense for businesses that have in-house platforms and expensive licenses.

Unique Capabilities

Spotlight Technology's consultants have over 75 years of combined experience in the configuration, implementation and optimization of data warehouse systems. Spotlight analysts can also assist in migrating current data warehouse systems from one platform to another...or into the Cloud.

Environments supported include Teradata, Microsoft SQL/Server, RedShift, Snowflake, and more. These databases may be cloud-based or on-premises.

Summary

Spotlight's goal is to assist new and existing customers to make optimum use of their data warehouse, BI, and analytical environments.
